                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         436
                                                                                                                                                                                                                                                                                                                                                                                          Human hippocampal Y5 receptor (AAR95939) was identified as the homologue of rat hypochalamic Y5 receptor (AAR95940), isolated as an 'atypical Y1 receptor belongs to the G protein-coupled receptor Superfamily. It is encoded by a cDNA clone (see also AAY30433) that was isolated from a hippocampus cDNA library using rat Y5 receptor CDNA as probe. Recombinant rat Y5 receptor can be produced in prokaryotic or eukaryotic (e.g. COS, 293 or S19 insect) host cells. It is used to identify Y5 ligands (agonists and antagonists) that can be used to treat observe, bulimia or anorexia, and to raise monoclonal antibodies useful
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     20

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               136
                                                                                                                                                                                                                                                                                                                                                                                                                         The present sequence represents human hippocampal neuropeptide (NP) Y receptor subtype Y5, with a pharmacological function associated with for example, obesity and eating disorders. The specification relates to a method of treatment and prophylaxis of disorders and diseases associated with NPY receptor subtype Y5 comprising administering to a warmblooded animal, including man, in need of such treatment a therapeutuically reffective amount of a quinazolin-2,4-diazirine compound. These disorders and diseases include e.g. eating disorders, obesity, bulimia nervosa, diabetes, dyslipidaemia, hypertension, memory loss, exual/reproductive disorders, depression, anxiety, cerebral haemorrhage, shock, congestive heart failure, nasal congestion or diarrhoea. (Updated on 25-MAR-2003 to correct P1 field.)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Use of new and known hetero:aryl compounds as NPY Y5-receptor antagonists - for treating and preventing eating disorders, diabetes, dyslipidaemia, hypertension, memory loss, epilepsy, migraine, etc.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              This sequence represents human hippocampal neuropeptide (NP) Y receptor subtype Y5, with a pharmacological function associated with for example, obessity and eating disorders. The specification relates to a method of treatment and prophylaxis of disorders and diseases associated with with NPY receptor subtype Y5 comprising administering to a warm-blooded animal, including man, in need of such treatment a therapeutically effective amount of a new heteroaryl compound. These disorders and diseases include e.g. eating disorders, obesity, bulimia nervosa, diabetes, dyslipidaemia, hypertension, memory loss, epileptic seizures, migraine, sleep disturbance, pain, sexual/reproductive disorders, depression, anxiety, cerebral haemorrhage, shock, congestive heart failure, nasal congestion or diarrhoea. Y5-r can be used in processes to determine whether a chemical compound specifically binds to and activates or inhibits a Y5-R by measuring a second messenger response. The chemical compounds can be used to increase or reduce the activity of a Y5-R. In particular, inhibitors can be used to treat obesity and activators can be used to treat anorexia. Antagonists capble of alleviating (by decreasing the activity of Y5-R) an abnormality can be identified by administering a potential antagonist to a transgenic mammal as above, and determining whether the substance alleviates the physical and behavioural abnormalities displayed by the transgenic mammal as a result of overactivity of a Y5-R. Agonists can be identified in a similar activity of Y5-R.

```

The present sequence represents the human hippocampal Y5 receptor. The Y5 receptor is a G-protein coupled neuropedide Y receptor found throughout the mammalian nervous system and is a powerful stimulant of feeding behaviour. Cells expressing DNA encoding the Y5 receptor can be used to determine whether a ligand specifically binds to a Y5 receptor. These cells or a cell extract, is exposed to the ligand and then any binding between the ligand and the receptor can be detected. The cells can also be used to determine whether a ligand is a Y5 receptor can also agonist. The binding of chemical compounds to a Y5 receptor can also determined and whether they activate or inhibit the activation of the Y5

The present invention relates to chimeric neuropeptide Y (NPY) receptors. The NPY receptors are G-protein-coupled transmembrane proteins with seven membrane spanning transmembrane (TM) domains. The compounds that modulate the activity of a NPY receptor is useful in the preparation of a medicament for treating conditions including obesity, high/low blood pressure, epilepsy, Huntington's and Parkinson's disorder and eating, seizure, locomotor and anxiety disorders. They can also be used as targets for drug actions, and as basis for drug discovery and development. The NPYS receptor may have an anti-epileptic activity in the control of limbic seizures. The present sequence is human NPYS receptor
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            77 AAGACACTIGCCACAGAGAATAATACTGCTGCCACTCGGAATTCTGATTTCCCAGTCTGG 136

This invention describes a novel method of modifying feeding behaviour of a subject which is a Y seceptor agonist or antagonist effective to compound which is a Y seceptor agonist or antagonist effective to increase or decrease, respectively, the consumption of food by the subject so as to modify feeding behaviour of the subject. The product of the invention has metabolic, anotectic, antidepressant, tranquiliser, antidiarabeic and heemostatic activity and can be used in a vaccine. Ys receptor agonist or antagonist compounds are useful for treating a nathormality alleviated by the inhibition or activation of Ys reacting an abnormality alleviated by the inhibition or activation of Ys receptor, in a subject. Antibodies raised against the receptor are useful for treating an abnormality alleviated by the inhibition or activation of Ys receptor, in a subject. Antibodies raised against the receptor are useful for detecting the presence of the receptor on the surface of a call. The agonist of X receptor is useful for treating an abnormality in a subject, where the abnormality includes anoreal productive disorder, depression, anxiety, memory loss, migraine, pain, epileptic seizure, hypertension, cerebral haemorrhage, shock, congestive heart failure, bleeve disturbance, nasal congestion, and diarrhoea. This sequence represents the human hippocamus YS receptor described in the
                                                                                                                                                                              Human; hippocampus; Y5; receptor; feeding behaviour; Y5 receptor; food consumption; metabolic, anorectic; antidepressant; tranquiliser; antimigratine; analgesic; hypotensive; cerebroprotective; cardiant; antidiarrhoeic; haemostatic; vaccine; anorexia; obesity; bulimia; sexual disorder; reproductive disorder; depression; anxiety; memory loss; migranne; pain; epileptic seizure; hypertension; cerebral haemorrhage; shock; congestive heart failure; sleeve disturbance; nasal congestion;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Modifying feeding behavior of subject, useful in treating feeding disorders, involves administering to subject Y5 receptor agonist or antagonist, to increase or decrease consumption of food by subject.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Branchek T;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Length:

This invention relates to novel ligands (derivatives of 2-cyclohexyl-4-phenyl-1H-inidazole) for the neuropeptide Y5 (NPY5) receptor. The NPY5 receptor mediates a variety of physiological effects and is involved in appetite regulation, hormone release and blood pressure. Ligands that modulate the NPY5 receptor inhibit or enhance NPY binding such that they can be used to treat a variety of conditions including feeding disorders (obesity and bulinia), psychiatric disorders, diabetes and cardiovascular diseases such as hypertension. Further uses relate to to the treatment of cerebral infarction, epilepsy, schizophramia, despession, angina, sudden cardiac death, vasospasm, arrhythmia, urinary incontinence, Crohn's neuroleptic, antilniflammatory, nootropic, vasotropic, anticonvulsant and uropathic. This polypeptide sequence is the human neuropeptide Y5 (NPY5) receptor protien of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     121 LysValMetCysHisIleMetProPheLeuGlnCysValSerValLeuValSerThrLeu 140

The invention relates to human and mouse g protein-coupled receptors

(GPCRs) and nucleic acids encoding them. The invention also relates to sequences at least 90% identical to the GPCR proteins and nucleic acids of treating, preventing or diagnosing diseases of the invention; methods of screening for associated with GPCRs of the invention; methods of screening for compounds useful in the treatment of GPCR-related diseases; at ransgenic mouse comprising a GPCR gene of the invention; a menuse comprising a mutation in a GPCR transgene or in an endogenous GPCR gene; cells derived from the transgenic mice; kits comprising several mice, each of which has a mutation in a different GPCR gene of the invention; and kits comprising probes which hybridise to GPCR polymucleotides of the invention. The invention further discloses variants of the GPCR polypeptides and vectors of probes which hybridise to GPCR polymucleotides of the invention. The invention further discloses variants of the GPCR polympeptides and vectors comprising a GPCR nucleic acid. The GPCR nucleic acid. Alzheimer's disease.

CC comprising a GPCR nucleic acid. The GPCR nucleic acids and proteins may be used in the disponeis, treatment or prevention of a wide variety of diseases including neurological disorders (e.g., Alzheimer's disease, diseases including neurological disorders (e.g., Alzheimer's disease, disease, disease, food poisoning or irritable bowel candernal gland; disorders (e.g., angina, cardiac arrhythmia or myconders of the adrenal gland; disorders (e.g., angina, cardiac arrhythmia or myconders (e.g., angina, cardiac arrhythmia or myconders of the disorders (e.g., angina, cardiac arrhythmia or angenema or leukaemia); immune disorders (e.g., angina, cardiac arrhythmia or there are disorders of the kidney, liver, lung, breast, overy, anamema or leukaemia); immune disorders (e.g., angina, cardiac arrhythmia or therus, prostate, testis, skin, stomedon, pancreas, spleen, thymus and thyroid (e.g., cancers).                                                                                                                                                        420
The present invention relates to chimeric neuropeptide Y (NPY) receptors. The NPY receptors are G-protein-coupled transmembrane proteins with seven membrane spanning transmembrane (TM) domains. The compounds that medulate the activity of a NPY receptor is useful in the preparation of a medicament for treating conditions including obesity, high/low blood pressure, epilepsy, Huntington's and Parkinson's disorder and eating, persoure, locomotors and anxiety disorders. They can also be used as targets for drug actions, and as basis for drug discovery and development. The NPYS receptor may have an anti-epileptic activity in the control of limbic seizures. The present sequence is african green monkey
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     comprising a single polypeptide chain of for drug actions, and as basis for drug
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Neuropeptide Y; NPY receptor; G-protein-coupled transmembrane protein; transmembrane; TM domain; therapy; obesity; blood pressure; eiplepsy; Huntington; & disorder; Parkinson's disorder; eating disorder; seizure; locomotor; anxiety disorder; limbic seizure; tranquilliser;

Nucleic acid molecule encoding neuro:peptide Y receptor - useful to PT identify antagonists and agonists, e.g. treat obesity, diabetes, PT hyperlipidaemia and anorexia.	XX PS Claim 2; Page 37-39; 49pp; English.	XXX A novel human receptor for the neurotransmitters neuropeptide Y (NPY) and CC peptide YY (PYY) is designated NPY YS receptor. Its amino acid sequence	was deduced from a human genomic DNA clone (see AAT87940). also been identified (see AAW27602-03). These polypeptides	expressed in host (e.g. human 293) cells. The effects of NPY include blood pressure regulation, memory enhancement, anxiolysis/sedation an increased fond in the contract of t	increased food intake. The receptor can therefore be used to antagonists and agonists capable of controlling these condi-

```

```
designated NPY-Y5 receptor, is a G-protein coupled receptor of NPY, which is involved in appetite/Obesity regulation. Its amino acid sequence was deduced from isolated genomic (AAT66909) and foetaal brain cDNA (AAT66910) sequences. Rat (AAM15232) and mouse (AAM15233) NPY-Y5 receptors have also been identified. NPY-Y5 receptors can be expressed on the cell surface of host (pref. CHO, human embryonic kidney 293 or insect £59) cells. The receptors or host cells can be used to screen for NPY (ant) agonists useful as potential hypotensives, cardiovascular drugs, neuronal growth factors, anti-psychotic, anti-obesity or anti-diabetic drugs
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       226

This sequence represents the human neuropeptide Y5 receptor (Y5) protein. The protein is useful for screening for compounds able to be used as agonists and antagonists to the Y5 receptor, especially for the treatment obesity and diabetes and for developing antibodies for the detection of the protein
                                                                                                                                                                                                                                                                                                                                       106

This sequence represents human neuropeptide Y (NPY) YS receptor, CDNA encoding which was isolated and amplified from a human neuroblastoma cell encoding which was isolated and amplified from a human neuroblastoma cell line using primers AA464512-6423. The receptor was transiently expressed in COS1 cells, Dit is leave to that of the rat NPY YS receptor. (AAY52579). The invention relates to a chimeric rat/Numan NPY receptor. Comprising the 5' untranslates to a chimeric rat/Numan NPY receptor. Comprising the 5' untranslated region (5' UTR) and extreme 5' coding comprising the 5' untranslated region (5' UTR) and extreme 5' coding comprising the 5' untranslated region (5' UTR) and extreme 5' coding comprising the 5' untranslated region (5' Edebtor, CDNA, When transfected into COS1 cells, the chimeric construct yielded levels of expression higher than the native human YS receptor. The pharmacological properties of the chimeric continer at YS receptor. The pharmacological properties of the chimeric corpus rat YS receptor. The pharmacological properties of the chimeric corpus and similar or greater levels of expression than the chimeric corpus for any wide range of physiological activities including effects on food intake, thermogenesis, blood pressure, hormone release, gut motility, conciented in the feet of and circadian rhythms, neuronal excitability, conciented and encitonal responses. NPY mediates the effects of physiological effects via interactions with at least six distinct Gracian coupled receptors (designated X1.Y6). The YS receptor mediates complexed to receptor, associated nucleic acids (e.g., expression vectors or antisense complexed such as obseity, hypertension, epilepsy, sexual dysfunction and disorders such as obseity, hypertension, epilepsy, sexual dysfunction and cit lag associated with abnormal expression/activity of NPY
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        286

ein-coupled receptor FC5 - rat

ies: Rattus norvegicus (Norvay rat)
1.12-Fb-1993 #sequence_revision 12-Feb-1993 #text_change 09-Jul-2004
Silon: S12863; S19101
C.; Keinaenen, K.; Monyer, H.; Seeburg, P.; Sprengel, R.
ett. 271, 81-84, 1990
e: Molecular cloning of a novel G protein-coupled receptor that may belong to the resence number: S12863; MuID:91032093; PMID:2172008
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                reacte numer; 219101

gastric CCK-A receptor - rabbit (Gomestic rabbit)
C)species: Oryccolagus cuniculus (domestic rabbit)
C)species: Oryccolagus cuniculus (domestic rabbit)
C)Accession: S50150
R)Reuben, M., Rishigh, L., Prinz, C.; Hersey, S.; Sachs, G.
B)cochim. Biophys: Acta 1219, 321-327, 1994
A)Title: Cloning and expression of the rabbit gastric CCK-A receptor.
A)Reference number: S50150; MUID:95002144; PMID:7918628
A)Accession: S50150
A)Status: preliminary
A)Andlecule type: mRNA
A)Accession: S10150
C)Superfamily: neurokinin 1 receptor
                                                                                                                                                                                                                                                                                                                                                                                    CICTATACATTIGIAAGICITCITGGGCTTTAIGGGGAAICTACTTAITTTAAIGGCTCTC

expression of the cholecystokini
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                A;Status: preliminary
A;Molecule type: protein
A;Residues: 366-389 «Man»
C;Comer: This G-protein-coupled receptor is present in the gastrointestinal system, vac
; smooth muscle contraction of the gallbladder and stomach. It is capable of activating I
ducing the subsequent release of intracellular calcium.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 A.Residues: 1-44 «MANA)
